### ***Software Updates***

DataCan's software has undergone changes to improve its functionality and make it more user friendly

Download cable drivers are now installed automatically during set-up.

Improvements have made programming gauges even faster.

For ease of use the Program/Download section has now been split into two separate sections.

Graphing is now faster and can show more than two gauges at once. The user has the option to show or hide the curves as needed. It is now possible to shift and scale temperature and pressure data and to shift time data. Previously if an annotation was added it would disappear when the graph was closed but now annotations are saved to file and recalled when the data is graphed again.

The real time logging section allows live data to be viewed and saved to file.

Improvements to the software with regards to the permanent system include the following: It now supports two surface gauges. It has approximately twenty million data sets which has increased from one million. It is now supporting Modbus.

Chart Recorder Software has been released to replace Barton. It takes the data from up to eight devices and records it on a standard circle chart. It is beneficial because the data can be logged to file, emailed, and opened and graphed later.

DataCan Software users should update the software at least every 3 months because improvements are constantly being made.
